ENEE/CMSC/MATH 456: Cryptography
Stream Cipher Class Exercise 3/30/20

***ALGORITHM 6.1***
**Init algorithm for RC4**

**Input:** 16-byte key $k$
**Output:** Initial state $(S, i, j)$
(Note: All addition is done modulo 256)

**for** $i = 0$ to 255:
  $S[i] := i$
  $k[i] := k[i \bmod 16]$
$j := 0$
**for** $i = 0$ to 255:
  $j := j + S[i] + k[i]$
  Swap $S[i]$ and $S[j]$
$j := 0, \quad i := 0$
**return** $(S, i, j)$

***ALGORITHM 6.2***
**GetBits algorithm for RC4**

**Input:** Current state $(S, i, j)$
**Output:** Updated state $(S, i, j)$; output byte $y$
(Note: All addition is done modulo 256)

$i := i + 1$
$j := j + S[i]$
Swap $S[i]$ and $S[j]$
$t := S[i] + S[j]$
$y := S[t]$
**return** $(S, i, j), y$

Let $S^0$ denote the initial state, $S^i$ denote the state after $i$ calls to **GetBits**.

Consider Event 1: $(S^0[2] = 0) \wedge (S^0[1] = X \neq 2)$

What is the probability that Event 1 occurs? (For this part, assume Init outputs a perfectly random permutation of the values from 0 to 255) _____

Assuming Event 1 occurs, what is the value of $S^1[X]$ (i.e. the value in position $S[X]$ after the first iteration? _____

Assuming Event 1 occurs, what is the value of $S^2[X], S^2[2]$ (i.e. the values in positions $S[X]$ and $S[2]$ after the second iteration? _____

Assuming Event 1 occurs, what value (call this V) is outputted in the second iteration?
_____

Assuming Event 1 does not occur, V is uniformly distributed.

Towards what value is V biased and with what probability? _____
