

ENEE/CMSC/MATH 456: Cryptography
Chinese Remainder Theorem Class Exercise 4/13/22

1. Use the method described in class to find the unique number x modulo 35 such that:

$$x \bmod 7 = 4$$

$$x \bmod 5 = 2$$

We first look for the elements x_1, x_2 modulo 35 that map to the basis elements $(1, 0)$ and $(0, 1)$.

Thus x_1 is such that $x_1 \bmod 7 = 1$ and $x_1 \bmod 5 = 0$.

x_2 is such that $x_2 \bmod 7 = 0$ and $x_2 \bmod 5 = 1$.

To find x_1, x_2 , we find X, Y such that $7X + 5Y = 1$. Then $x_1 = 5Y$ and $x_2 = 7X$.

Note that $7*(-2) + 5(3) = 1$.

So $x_1 = 15$ and $x_2 = -14$.

Thus $(4, 2) = 4*(1, 0) + 2*(0, 1) \rightarrow 4*x_1 + 2*x_2 = 4*15 + 2*(-14) = 60 - 28 = 32$.

Final answer: $x = 32$.

2. Use the method described in class to find the unique number x modulo 56 such that:

$$x \bmod 7 = 5$$

$$x \bmod 8 = 3$$

We first look for the elements x_1, x_2 modulo 56 that map to the basis elements $(1, 0)$ and $(0, 1)$.

Thus x_1 is such that $x_1 \bmod 7 = 1$ and $x_1 \bmod 8 = 0$.

x_2 is such that $x_2 \bmod 7 = 0$ and $x_2 \bmod 8 = 1$.

To find x_1, x_2 , we find X, Y such that $7X + 8Y = 1$. Then $x_1 = 8Y$ and $x_2 = 7X$.

Note that $7*(-1) + 8(1) = 1$.

So $x_1 = 8$ and $x_2 = -7$.

Thus $(5, 3) = 5*(1, 0) + 3*(0, 1) \rightarrow 5*x_1 + 3*x_2 = 5*8 + 3*(-7) = 40 - 21 = 19$.

Final answer: $x = 19$.
