

# Cryptography

## Lecture 7

# Announcements

- HW3 up on course webpage, due Wednesday, 2/22

# Agenda

- Last time:
  - SKE secure against eavesdroppers from PRG (K/L 3.3)
- This time:
  - Stream Ciphers
  - CPA Security (K/L 3.4)
  - Pseudorandom Functions (PRF) (K/L 3.5)

# Stream Cipher

Sender

State  $s_i$  after sending the  $i$ -th message:

$$\begin{aligned} s_0 &:= k \\ s_{i+1} &:= G(s_i)_2, \dots, G(s_i)_{n+1} \\ pad_{i+1} &:= G(s_i)_1 \end{aligned}$$

$$c_{i+1} := m_{i+1} \oplus pad_{i+1}$$

Receiver

State  $s_i$  after receiving the  $i$ -th message:

$$\begin{aligned} s_0 &:= k \\ s_{i+1} &:= G(s_i)_2, \dots, G(s_i)_{n+1} \\ pad_{i+1} &:= G(s_i)_1 \end{aligned}$$

$$m_{i+1} := c_{i+1} \oplus pad_{i+1}$$

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

$k \leftarrow Gen(1^n)$

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

$A^{Enc_k}(\cdot)$

Challenger

$k \leftarrow Gen(1^n)$

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

$A^{Enc_k(\cdot)}$

$m'$

$k \leftarrow Gen(1^n)$

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

$A^{Enc_k(\cdot)}$

$m'$

$c'$

$k \leftarrow Gen(1^n)$

The diagram illustrates the interaction between an Adversary and a Challenger in a CPA security experiment. Two horizontal blue arrows represent the communication. The top arrow points from the Adversary to the Challenger and is labeled with  $m'$ . The bottom arrow points from the Challenger to the Adversary and is labeled with  $c'$ . The Adversary is labeled  $A(1^n)$  and  $A^{Enc_k(\cdot)}$ . The Challenger is labeled Challenger and  $k \leftarrow Gen(1^n)$ .

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

$A^{Enc_k(\cdot)}$

$m'$

$c'$

$\vdots$

$k \leftarrow Gen(1^n)$

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

$A^{Enc_k(\cdot)}$

$k \leftarrow Gen(1^n)$

$m'$

$c'$

$\vdots$

$m_0, m_1$

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

$A^{Enc_k(\cdot)}$

$k \leftarrow Gen(1^n)$

$b \leftarrow \{0,1\}$

$c \leftarrow Enc_k(m_b)$

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

$A^{Enc_k(\cdot)}$

$k \leftarrow Gen(1^n)$

$c'$

$\vdots$

$m_0, m_1$

$b \leftarrow \{0,1\}$

$c$

$c \leftarrow Enc_k(m_b)$

$A^{Enc_k(\cdot)}$

$m'$

$c'$

$\vdots$

$b'$

# CPA Security

Consider a private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$ , any adversary  $A$ , and any value  $n$  for the security parameter.

Experiment  $PrivK_{A,\Pi}^{cpa}(n)$

Adversary  $A(1^n)$

Challenger

$PrivK_{A,\Pi}^{cpa}(n) = 1$  if  $b' = b$  and  $PrivK_{A,\Pi}^{cpa}(n) = 0$  if  $b' \neq b$ .

# CPA-Security

The CPA Indistinguishability Experiment  $PrivK^{cpa}_{A,\Pi}(n)$ :

1. A key  $k$  is generated by running  $Gen(1^n)$ .
2. The adversary  $A$  is given input  $1^n$  and oracle access to  $Enc_k(\cdot)$ , and outputs a pair of messages  $m_0, m_1$  of the same length.
3. A random bit  $b \leftarrow \{0,1\}$  is chosen, and then a challenge ciphertext  $c \leftarrow Enc_k(m_b)$  is computed and given to  $A$ .
4. The adversary  $A$  continues to have oracle access to  $Enc_k(\cdot)$ , and outputs a bit  $b'$ .
5. The output of the experiment is defined to be 1 if  $b' = b$ , and 0 otherwise.

# CPA-Security

Definition: A private-key encryption scheme  $\Pi = (Gen, Enc, Dec)$  has indistinguishable encryptions under a chosen-plaintext attack if for all ppt adversaries  $A$  there exists a negligible function  $negl$  such that

$$\Pr \left[ PrivK^{cpa}_{A, \Pi}(n) = 1 \right] \leq \frac{1}{2} + negl(n),$$

where the probability is taken over the random coins used by  $A$ , as well as the random coins used in the experiment.

# CPA-security for multiple encryptions

Theorem: Any private-key encryption scheme that has indistinguishable encryptions under a chosen-plaintext attack also has indistinguishable multiple encryptions under a chosen-plaintext attack.

# CPA-secure Encryption Must Be Probabilistic

Theorem: If  $\Pi = (Gen, Enc, Dec)$  is an encryption scheme in which  $Enc$  is a deterministic function of the key and the message, then  $\Pi$  cannot be CPA-secure.

Why not?

# Constructing CPA-Secure Encryption Scheme

# Pseudorandom Function

Definition: A keyed function  $F: \{0,1\}^* \times \{0,1\}^* \rightarrow \{0,1\}^*$  is a two-input function, where the first input is called the key and denoted  $k$ .

# Pseudorandom Function (PRF)

PRF: Any efficient  $A$  cannot tell which world it is in.

$$|\Pr[A^f() = 1] - \Pr[A^{F_k}() = 1]| \leq \textit{negligible}$$

# Pseudorandom Function

Definition: Let  $F: \{0,1\}^* \times \{0,1\}^* \rightarrow \{0,1\}^*$  be an efficient, length-preserving, keyed function. We say that  $F$  is a pseudorandom function if for all ppt distinguishers  $D$ , there exists a negligible function  $negl$  such that:

$$\left| \Pr[D^{F_k(\cdot)}(1^n) = 1] - \Pr[D^{f(\cdot)}(1^n) = 1] \right| \leq negl(n).$$

where  $k \leftarrow \{0,1\}^n$  is chosen uniformly at random and  $f$  is chosen uniformly at random from the set of all functions mapping  $n$ -bit strings to  $n$ -bit strings.
