

ENEE 417 Presentation Requirements, Fall 2004

This presentation is to orally describe to the laboratory section the main ideas and experimental results related to your base paper. Especially you should be able to explain your circuit (what it is, what it does, and how it operates).

- a. Each student should come with enough printouts for the entire section, as well as all of the four TAs, of a 1 page summary (and no more than 3 pages) that has the key circuit that will be presented and any describing equations. In this way every student in the section and every instructor will have a copy.
- b. There is a commentator assigned to each paper - that person should study the base paper in enough depth to be able to ask three meaningful questions during the presentation. Those questions should be also submitted in written form to the instructor at the end of the period of the paper's presentation.
- c. The time allotted for the presentations including 5 minutes for answering questions will be the total section time (170 minutes) divided by the number of students in the section.
