ENEE 434 Information for Presentations

Second Presentation
1.   This is a 30 minute presentation which should consist of a discussion of the main results obtained from the base paper, including the main neural network simulated, describing equations, motivation and results obtained/anticipated, and any difficulties encountered.
        Computer power point presentations are most desired since they are becoming standard for professional society presentations. These should be on a USB memory stick (for use in the classroom PC), or via the internet web. .

2.   If there is an update to the one page handouts of the first presentation this should be brought for the whole class. Otherwise the audience should use the previous handout for reference of the key ideas.

3. [Commentator Duties]   At the end of the presentation the Commentator will have up to 7 minutes in which to ask up to three questions. Also two written copies of the three questions should be turned in. These too will be graded primarily as to depth of concept. The Commentator should also comment on any concepts that are key to the presenter's circuits which the audience should be further informed about, such as other alternatives and other results.
